REPORT ON THE MEDICAL DEPARTMENT FOR THE YEAR 1906.*

VITAL STATISTICS.

2. The deaths recorded during the year exceeded the births. The mortality and birth-rate for each nationality (calculated from figures which exclude any account of emigrants and immigrants, the facts about whom cannot be accurately stated) appear as follows:

BIRTH AND DEATH-RATES PER 1,000 LIVING.

			Europeans and Eurasians.	Chinese.	Malays.	Tamils.	Others.	Total population.
Births	•••	•••	20	6	31	15	37	20.8
Deaths	•••	•••	14	31	26	105	64	20.9

It will be seen that while the Malays and Eurasians are increasing, among the Chinese and Tamils the deaths greatly exceed the births.

- 3. The admissions to hospital largely exceed the total of the preceding year. The increase has been mainly at the Seremban District Hospital—16 per cent. more cases than in the preceding year—and consisting chiefly of Tamils sent from the estates in the district.
- 4. The class of patients sent in from the estates consists of cases too serious to treat on the plantations. They are for the most part very seriously ill—in fact often moribund on admission—so that it is not surprising that as a result the mortality among them is very high, and the general mortality of all hospitals is raised in consequence.
- 5. As a set-off against the great sickliness of the Tamil community, beri-beri—in former years the chief source of mortality among Chinese—has become everywhere less prevalent, affording 11 per cent. of admissions as against 17 per cent. in 1905, and causing a lower proportion of the deaths in hospitals, 7.8 per cent. of all deaths instead of 9.4 per cent.
- 6. The actual number treated in all hospitals during the year was 23,703, of whom 8,948 were in-patients. The case-mortality was 10.6 per cent. as compared with 7.9 per cent. in the previous year. Excluding deaths happening within 48 hours of admission—i.e., moribund and hopeless cases—the rate was 8.5 per cent. as compared with 5.8 per cent. in the previous year. As I have pointed out, the principal cause of this unsatisfactory increase was the condition of affairs at the Seremban District Hospital, where two-thirds of all the cases were treated.

KUALA PILAH AND TAMPIN.

- 7. At Kuala Pilah and Tampin, under the care of Assistant Surgeons De Vries and Sen, respectively, the mortality has considerably declined; 7.4 per cent. at Kuala Pilah as compared with 10 per cent.; at Tampin 6 per cent. as compared with 9 per cent. I am glad to attribute this satisfactory result to the careful work of these officers.
- At Jelebu the mortality is considerably higher than last year, 8.7 per cent. as compared with 5.9 per cent., although the actual cases treated were fewer, as also the proportion of them admitted in a serious condition.

JELEBU.

8. At Jelebu the rate was 8.7 per cent. including all deaths, or 6.6 per cent. excluding those dying within 48 hours.

MANTIN.

9. At Mantin (in charge of a Dresser, Mr. P. La Brooy) the gross mortality has also slightly increased. But at Mantin many cases of severe beri-beri have been admitted, and excluding deaths (chiefly from this cause) occurring within 48 hours of admission, the mortality at Mantin was slightly lower than last year.

PORT DICKSON.

10. At Port Dickson hospital, used last year only as a home for convalescents, during this year local cases have also been admitted, including many decrepit Tamils from estates newly opened in the neighbourhood. The death-rate has as a consequence increased at Port Dickson.

SEREMBAN DISTRICT HOSPITAL.

11. The Seremban District Hospital, in charge of District Surgeon, W. S. Milne, shows the largest gross mortality, 12.9 per cent. of all cases treated, or excluding deaths occurring within 48 hours, 10.3 per cent. Of the admissions for the year 51 per cent. were Tamils as compared with 33 per cent. in 1905. The case-mortality among the patients of this class was 12 per cent., one-fifth of the actual deaths occurring within 48 hours of admission. Among other nationalities treated the death-rate was only 8.1 per cent.

PRISON INFIRMARY.

12. At the Prison, with a lower daily average strength, there was a larger number of admissions to hospitals, this being chiefly due to an outbreak of dysentery, apparently caused through contaminated water supply. There were, however, but few deaths, only $2\frac{1}{2}$ per cent. of all cases treated.

GENERAL.

- 13. It is interesting to observe that of the whole population, medical relief in some form or another was afforded to 16 per cent. of persons living, of the Chinese 8 per cent. were admitted as in-patients, of the Malays 0.4 per cent., and of the Tamils 57 per cent.
- 14. Turning to the classes of diseases treated, the chief disorder for which admission to the hospital was sought was malarial fever, 28 per cent. of all admissions; the next dysentery, 13.8 per cent.; beri-beri furnished 11 per cent. of all cases; simple diarrhea and pulmonary diseases, 4 per cent. each, respectively. The balance of the cases being minor ailments mostly surgical. As regards the severity of the various disorders:—Dysentery and diarrhea head the list, the former disease with a mortality of 27 per cent. furnishing more than one-third of all the deaths in hospital. Of the cases of diarrhea, fortunately few, nearly 1 in every 3 died. Such cases represent usually the terminal phase of the opium habit. Pulmonary diseases (pneumonia and phthisis) furnished 11 per cent. of the deaths, nearly 1 in every 3 of such cases dying. In this group pneumonia and phthisis account for most of the deaths. Their mortality being 60 per cent.
- 15. In reference to dysentery the District Surgeon makes an instructive comparison of the mortality of cases which are early taken in hand and that of patients who have been neglected. At the Gaol, where a small epidemic broke out early in the year, of 80 such patients with amoebic dysentery, three only died, whereas among neglected patients (as the coolies brought from estates to the hospitals) the death-rate as mentioned above was no less than 27.7 per cent.

VACCINATION.

16. Three thousand two hundred and ninety-six persons were vaccinated during the year, with a percentage of successes, among the cases seen, of 83 per cent. No less than 20 per cent. of the cases were, however, reported as "not seen." Of the total number 2,109 were done by the newly trained native gurus. The Government have sanctioned a payment to these gurus at 20 cents for each successful case. The cost of inoculation by the travelling vaccinator amounts almost exactly to 1 dollar each. There is no reason to suppose that the operations of the former are any less efficient. The establishment of this system is therefore a step on which the Government have some cause to congratulate themselves, and it might profitably be adopted in the other States.

RAINFALL RETURN.

18. This return shows a surprising conformity in the distribution of the fall this year and last. The average for all stations being 86 inches as compared with $84\frac{1}{2}$ in 1905.

W. L. BRADDON,

State Surgeon.
